Overview

End-of-Day is the process of reconciling all oLPNs shipped with a specific carrier for a given day. It is the last step in the parcel execution process and is equivalent to closing an open manifest for the day. Operationally, End-of-Day (EOD) is typically executed after all oLPNs are manifested and loaded onto the parcel carrier's trailer. The process is user-initiated and triggered from the Parcel End-of-Day Requests UI.
There are two parcel interfaces used during the end-of-day process:

- **End-of-Day** - The inputs to this interface are carrier, date, and location.
  - The parcel provider executes a closeout process, which may include generating manifest reports and transmitting electronic data to the carrier.
  - Parcel providers may complete the end-of-day process in a single request or may require subsequent polling requests to determine the status of the End-of-Day process. If the initial End-of-Day request returns with a started status, WM polls the parcel provider periodically with the End-of-Day ID from the initial response to determine if the EOD process is complete. Note: this is unique to 3rd party EPI vendors; direct carrier Web services (for example, native FedEx) do not require polling.
  - Once the End-of-Day process is complete, the carrier or parcel vendor responds with a finished status and optionally a unique End-of-Day ID and list of tracking numbers for the packages closed as part of the process.
    - If the tracking numbers are included, these specific oLPNs are updated with the external manifest as the End-of-Day ID returned to the parcel provider response.
    - If tracking numbers are not included, the oLPNs with matching calculated ship date and carrier are updated with the external manifest as the End-of-Day request ID.
  - Some parcel providers may include documents in the response; if they are provided and *Auto-Print End-of-Day Documents* is enabled in the Shipping Parameters UI, the documents are directly printed. If *Auto-Print End-of-Day Documents* is not enabled in Shipping Parameters, then the documents may be printed using Parcel End-of-Day Requests UI.

    Note: The solution only supports a single response with a single EndOfDayId in the EndOfDays section.

- **End-of-Day Document** - This interface retrieves all documents for an End-of-Day ID if documents were not previously included in the End-of-Day response. Documents provided in the response, if any, are printed through configuration in the Shipping Parameters.

End-of-Day Process Workflow

The End-of-Day process is initiated and continuously polled until either an error message or successful message is returned from the parcel provider or the *Maximum Number of Polling Attempts* has been exhausted.

Shipping Parameters

The Shipping Parameters configuration defines several business parameters that control End-of-Day processing.

Field	UI Field Type	Description
Auto-Print End-of-Day Documents	radio button (boolean)	This parameter determines whether documents generated during the end-of-day process are printed automatically to the specified printer. If the documents are not printed automatically, then the documents may be printed using the Parcel End-of-Day Requests UI.
Printer Id	dropdown	The printer for automatically printed end-of-day documents.
End-of-Day Maximum Poll All Attempts	textbox	The maximum number of polling attempts for an end-of-day request. If the request is not complete after the polling attempts are exhausted, the end-of-day can be re-initiated using Parcel End-of-Day Requests.
Ship Confirm on End-of-Day	radio button (boolean)	This parameter determines whether ship confirm is automatically initiated when the end-of-day process is complete.

Validations

Error Code	Error Message	Message Type	Error Level	Validation
DCS::208	End of day request creation failed as there were no oLPNs manifested for the selected carrier and date.	SYSTEM	ERROR	The error is displayed if there are no oLPNs manifested for the selected carrier and date

Copyright © 2026 Manhattan Associates, Inc.

Error Code	Error Message	Message Type	Error Level	Validation
DCS::207	A request for Submitted/In-Progress status already exists for the carrier and date.	SYSTEM	ERROR	The error is displayed if open requests exist for the requested carrier and date and use attempts to initiate a duplicate end of day
