  - Overview
  - Inventory Attributes
  - Resource Attributes
  - Task Manager Attributes
  - Bulk, Score, and Location Attributes
  - Actions

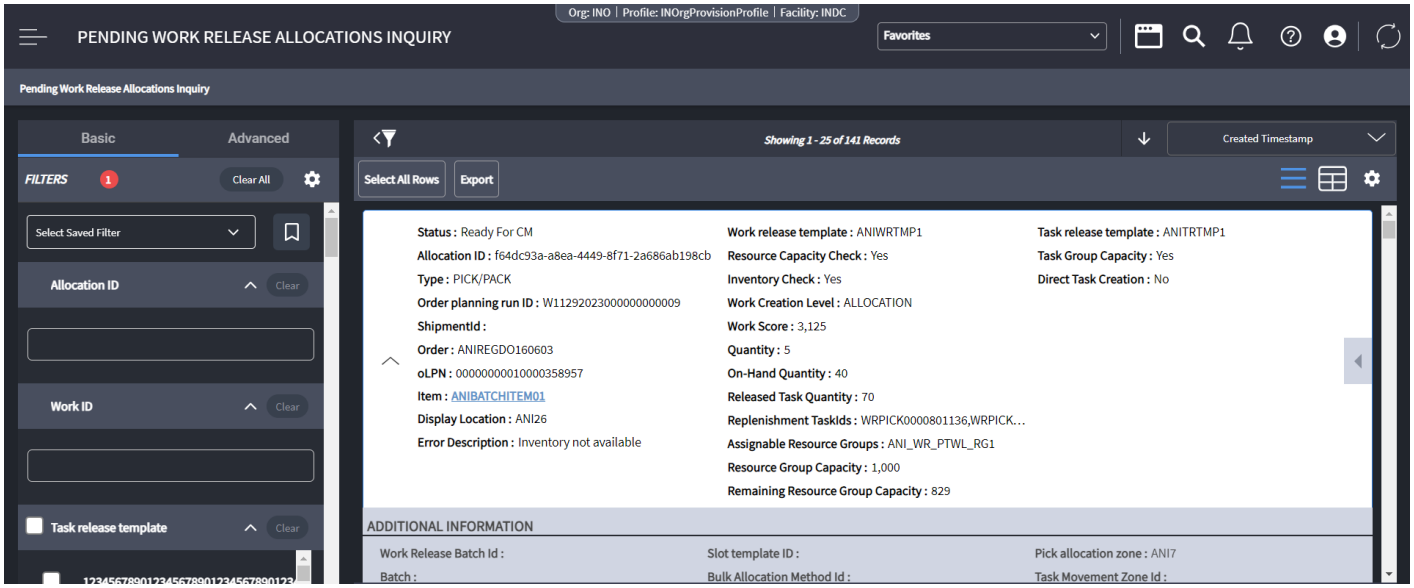
Overview

The Pending Work Release Allocations Inquiry can be used to view all the pending work release allocations in "Ready for CM", "Ready for Tasking", "Processing Error" and "Template Assignment Failed" status. This screen provides essential information to troubleshoot the reason these allocations are held up by the work release.

Users can navigate to this screen by searching for Pending Work Release Allocations Inquiry from the Menu search bar or by selecting a work release allocation in the Work Release Allocations UI and clicking on 'Related Links' and selecting the Pending Work Release Allocations Inquiry option. All the Work Release Allocation attributes are available for filtering the allocations.

The primary card has essential data related to work release allocations, inventory capacity, and task attributes and the expanded card has additional information related to work release allocation.

The information provided is conditional, and not all allocations will display all the information. For example, an allocation that is stuck in "Ready for CM" status due to insufficient inventory will not display information about task group capacity.



Inventory Attributes

The Inventory Attributes section displays information related to the current inventory capacity, which includes the on-hand, to be filled, allocated, and released task quantity. It also displays the list of any open replenishment task IDs for the particular location. This information won't be displayed for allocations that are stuck in "Ready for Tasking" status.

Resource Attributes

The Resource Attributes section displays information related to the current resource group maximum and remaining capacity along with the count batches in different statuses and the list of eligible resource groups. The batch-related information won't be displayed for allocations that are stuck in "Ready for CM" status due to insufficient inventory and the allocations that are stuck in "Ready for Tasking" status.

Task Manager Attributes

The Task Manager Attributes section displays information related to the current task group maximum and remaining capacity along with the list of eligible task groups, templates, transaction type, transaction ID, and task execution mode. This information won't be displayed for allocations that are stuck in "Ready for CM" status.

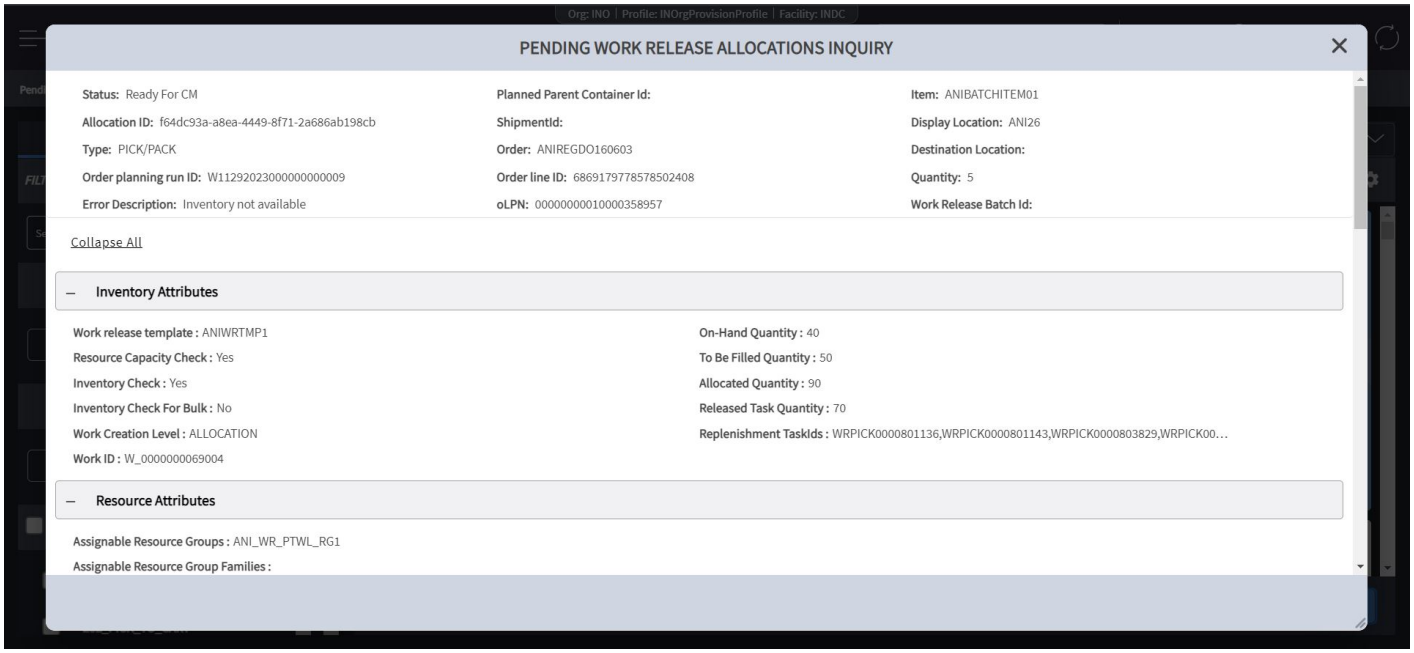
Bulk, Score, and Location Attributes

The Bulk, Score, and Location Attributes sections display information related to distribution quantity, distribution key, allocation score, work score, cutoff date/time, pick allocation, execution sequence, etc.

Actions

The Pending Work Release Allocations Inquiry screen supports the following actions:

- Details - Displays a modal with information on Inventory, Resources, Task Manager, Bulk, Score, and Location attributes.



- Generate Task - This action can be taken on allocations that are in "Ready for CM" or "Ready for Tasking" status. This action bypasses the inventory, resource, and labor constraint checks and creates tasks if a valid template is assigned. However, the minimum task thresholds are not overridden during the task creation when the action is selected. This is applicable for allocation types Pick/Pack, Pick and Replenishment.

Note: In the bulk scenarios, if Pick allocation(s) are selected to override constraints and generate tasks, some oLPNs or picks may be released partially. This can happen when inventory is distributed from the selected pick allocation(s) to a pack allocation that still requires additional items. Such scenarios should be managed operationally.
