oLPN Consolidation Configuration

Last updated: 03/24/2025

- Configuration Hierarchy
- Order Planning Strategy
- DC Consolidation Strategy
- Consolidation Rules
- Consolidation Sequencing Criteria
- Consolidation Criteria
- Consolidation Zone Configuration
- Consolidation Dedication Configuration
- Zone
- Consolidation Location

This functionality provides a single point of configuration for consolidation. Consolidation location determination is based on a rules framework.

Consolidation Configuration includes:

- Consolidation Strategy
- Consolidation Criteria
- Consolidation Rules
- Consolidation Sequencing Criteria
- Consolidation Zone Configuration
- Consolidation Dedication

This document describes each configuration element of configuration in detail.

Configuration Hierarchy

Order Planning Strategy

Order Planning Strategy provides the ability to configure parameters for various functions performed in an Order. The parameters relevant to Consolidation in Order Planning Strategy include the Consolidation Strategy. As part of the Override Parameters, the following pertain to consolidation:

1. Deselect Order (Y/N)
    - This parameter determines whether or not an order is deselected when pre-defined error scenarios occur.

2. Discrete Consolidation (Y/N)

- This parameter determines whether consolidation needs to be performed in separate threads for unique Consolidation Criteria.

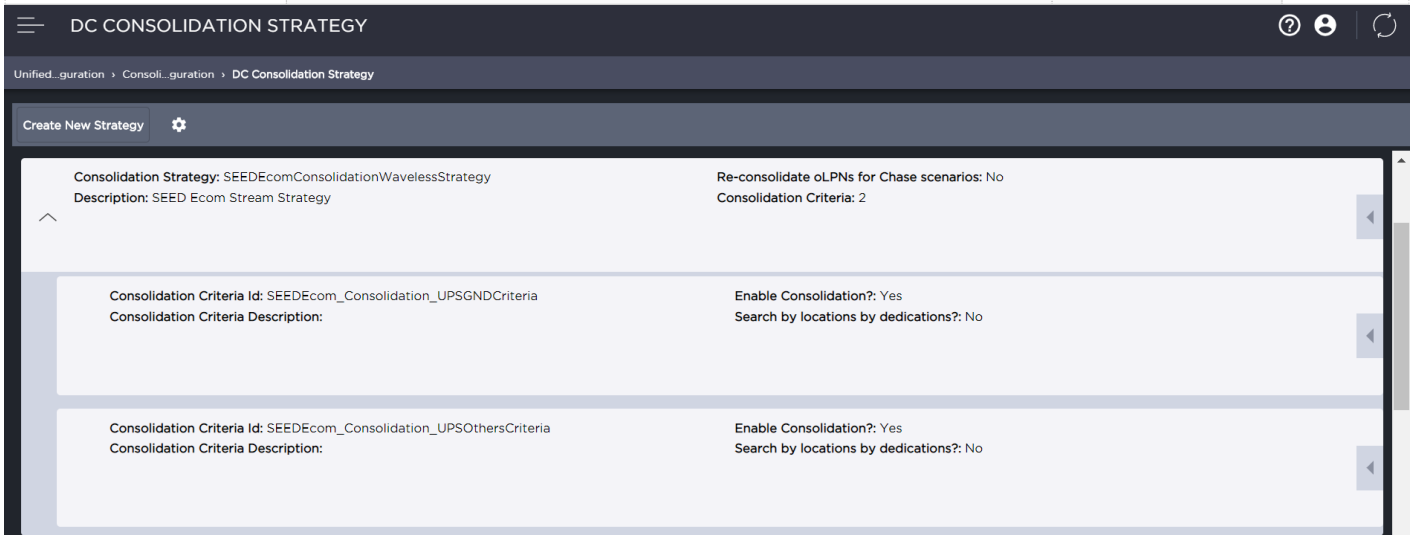
For more details on Order Planning Strategy, refer Order Planning Strategy Configuration guide.

DC Consolidation Strategy

Consolidation Strategy is a grouping of various parameters that can be used to control system behavior during consolidation. Users need to choose a Consolidation Strategy appropriate for a wave by specifying it on the Order Planning Strategy page. The same can be accomplished for the waveless process as well.

The following are the attributes of the Consolidation Strategy:

Name	Description	Valid Values	Mandatory
Consolidation Strategy ID	Consolidation Strategy Name	User-Defined	Y
Brief description indicating the purpose of the strategy	Brief description to indicate the purpose of the strategy	User-Defined	N
Reconsolidation oLPNs for Chase scenarios	This determines whether to re-consolidate chased oLPNs if they were consolidated earlier than originally planned before shorting. This is applicable when an order is at oLPN level.	True	Y
		False	
Should Consolidation deselect an order if it cannot determine a consolidation location for any of its oLPNs?	When this flag is turned on, WM deselects the Order in the wave in case of a failure such as when it cannot find a consolidation location for the oLPN. When this flag is turned off, WM continues processing without deselecting the order. In the waveless flow, this flag is not configurable and always turned off.	Deselect on Failure	Y
	This attribute need not be configured when Order Planning Mode = Stream. The default value of "Continue on Failure" is the only mode supported in this scenario.	Continue on Failure (Default)	



Consolidation Rules

Consolidation Rules are user-defined rules where Rule Conditions can be set up using attributes of:

- Order Line
- oLPN Header
- oLPN Detail
- Order/Order Line Notes
- Item and
- Facility

Once an oLPN is successfully evaluated against a rule, the Consolidation Criteria associated with the rule is used subsequently.

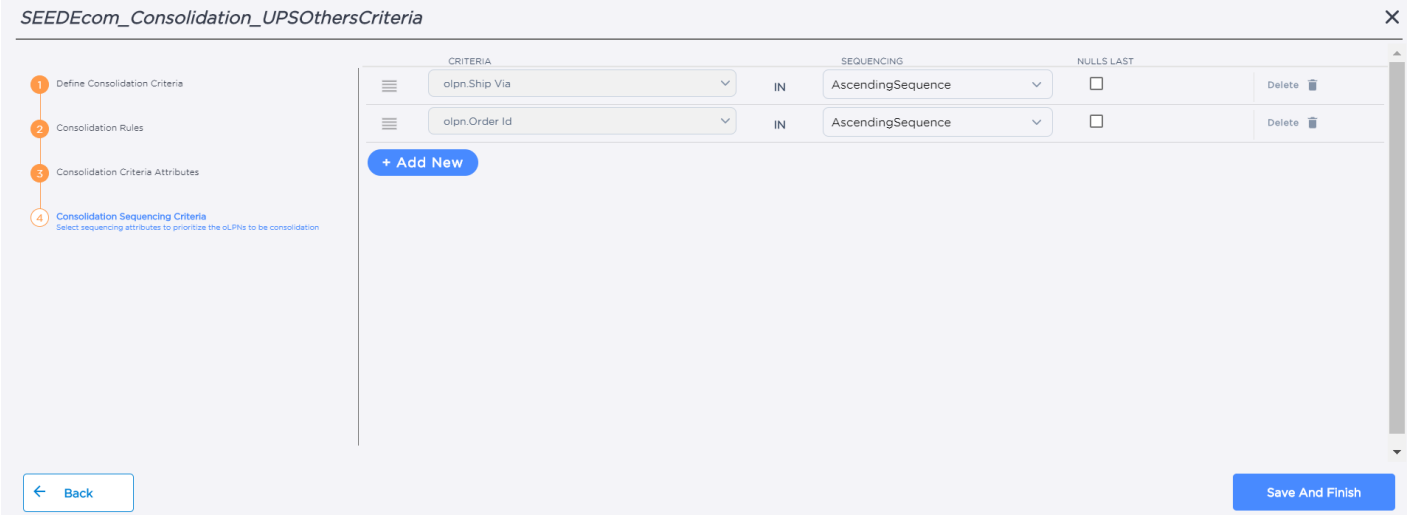
Consolidation Sequencing Criteria

Consolidation Sequencing Criteria is used to configure the Order Header/oLPN Header fields by which oLPNs should be sequenced before the oLPNs are processed.



Consolidation Criteria

An oLPN that satisfies at least one rule for the Consolidation Criteria is eligible to be directed to a location in the associated Prioritized Zone List. Consolidation Criteria include various parameters controlling the oLPNs that are to be consolidated. The following table describes the entity structure of the Consolidation Criteria:

Name	Description	Valid Values	Mandatory
Consolidation Criteria Description	Brief description to indicate the purpose of the criteria	User-Defined	N
Criteria Name	Consolidation Criteria Name	User-Defined	Y
Sequencing Criteria	oLPNs are sequenced per the Sequencing Criteria setup.	User-Defined	N
Should the system perform consolidation for the selected oLPNs?	When this flag is turned on, consolidation is performed for the oLPN. If it is turned off, the oLPN is not consolidated and no exception processing will be applied for the oLPN. This flag is useful when certain oLPNs of an order is not required to be consolidated. Configuring a criterion where this flag is turned off and setting up appropriate rules ensure that WM does not consolidate the oLPN.	True (Default)	Y
	The remainder of the Consolidation Configuration is not necessary when this flag is turned off.	False	
Should the system search locations by already applied locks or by location priority?	By default, WM evaluates consolidation locations in a priority sequence. When this flag is turned on, WM first tries to consolidate the oLPN to a location that is already locked with the same attribute values as the oLPN. If no such location is found, then WM falls back to the default location search method.	True	Y
		False(Default)	
Zone Configuration	Select the Consolidation Zone Configuration from the Drop Down List to determine the zones and zone priorities. Zone configuration also controls whether this criterion will work in Temporary mode or permanent mode for waves.	Drop down from pre-configured list	N
Dedication Configuration	Select the Dedication Configuration from the Drop down list to determine the Dedication Attributes, the Dedication Levels and static dedication values at the criteria level.	Drop down from pre-configured list	N

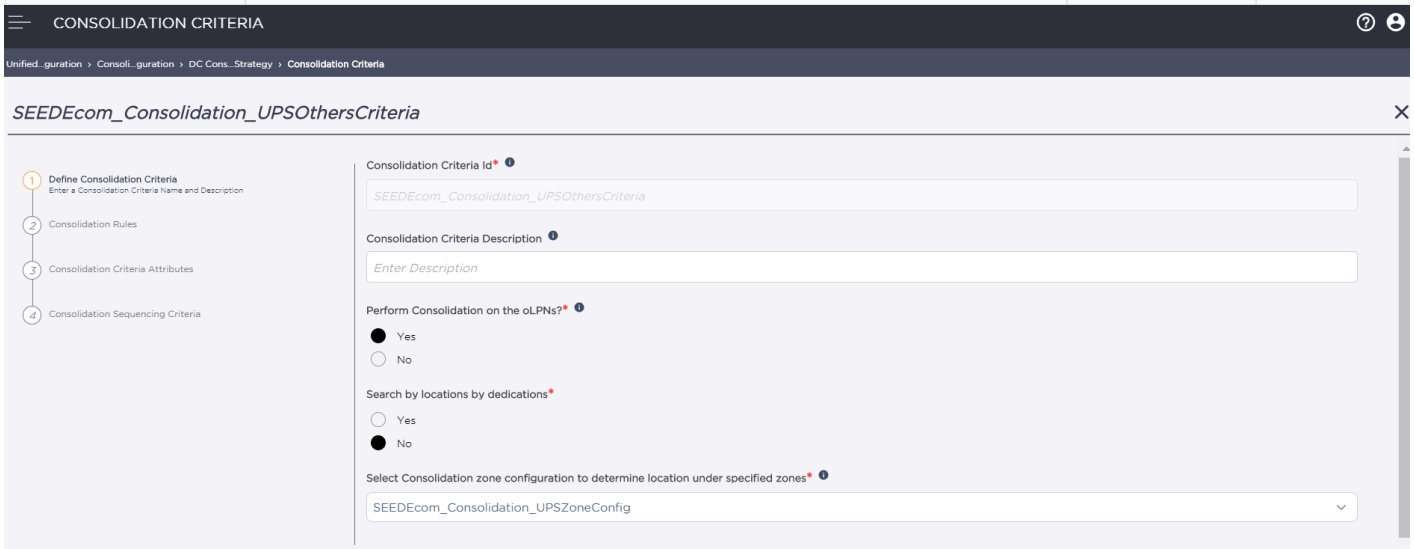
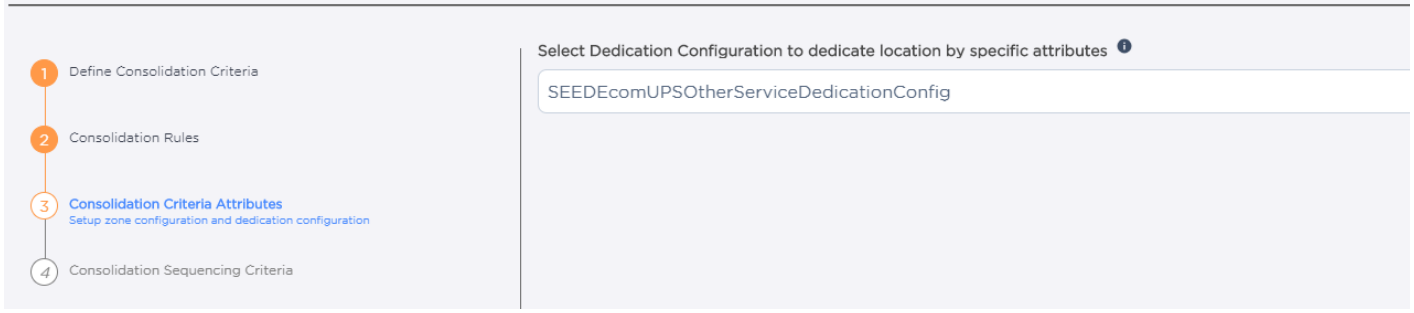
Name	Description	Valid Values	Mandatory
Choose an option to specify how the staging location is determined.	This parameter signifies the alternate option to determine the staging location. Here, currently system allows to config - • "Zone Config from Dock Door": The solution uses Consolidation Zone Config ID associated with the Dock Door linked to the shipment. The solution loads all the staging locations associated with the Consolidation Zones of the Zone Config ID, ordered in natural order by zone priority and consolidation location sequence and then determines one of these locations. • "Staging Location from Shipment or Stop". Here the staging location linked to the shipment/stop will be returned. • "Order Staging Location Assignment". The solution suggests the location, if any of the oLPNs of the order is located at the staging or consolidation location.	Drop down. None "ZoneConfig from Dock Door" "Staging Location from Shipment or Stop"	N
Validate dedication config against transactional dedication data?	This parameter indicates that oLPN's request and criteria has the same configuration as the location is already dedicated to. Location which is already dedicated with dedication config DC1,then send another oLPN request which matches the criteria and has a different/no dedication config, then it will say dedication config mismatch	True(Default)	N
	It will not complain about dedication config mismatch	False	
Should the system suggest the most recent assigned location?	By default, WM evaluates consolidation locations in a priority sequence. If this parameter is set to Yes , the system will set a user-scanned alternate location as the new leader in 'Follow the Leader' OB putaway and this location will be prompted for the next container putaway with the same consolidation level.	True /False (Default)	N
Upon determining the final staging location for an oLPN, should the system automatically assign the oLPN's shipment to the associated dock door?	Indicates whether to automatically assign the oLPN's shipment to the associated dock door in determining the final staging location for the oLPN	True /False (Default)	N



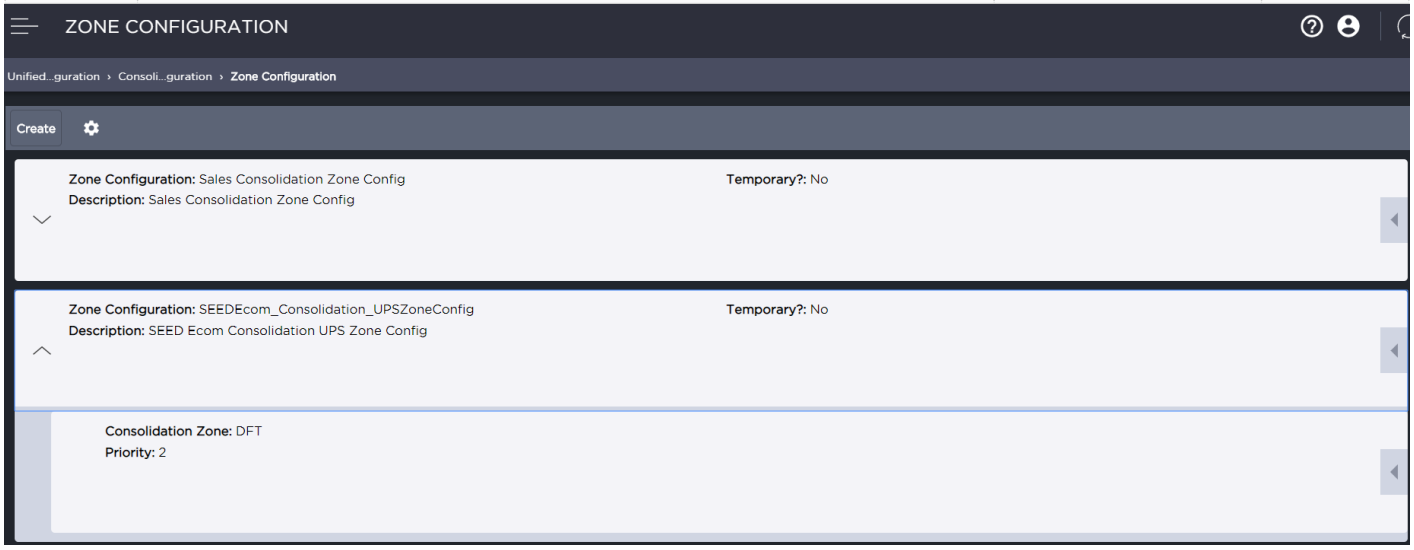


Consolidation Zone Configuration

Consolidation Zone Configuration lists Zones that are eligible for the Consolidation Criteria.

Name	Description	Valid Values	Mandatory
Zone Configuration	Zone Configuration Name	User-Defined	Y

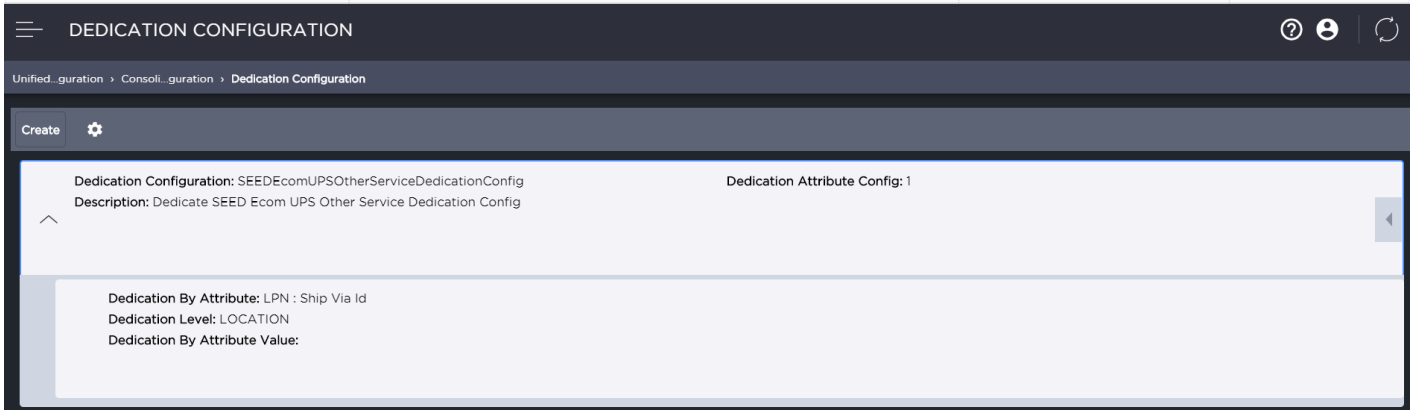
Name	Description	Valid Values	Mandatory
Description	Description for the zone configuration	User-Defined	N
Is Temporary	This determines if the zone list configuration contains temporary or permanent zones.	True False (Default)	Y
Zone Priority	Defines the priority in which the zone should be processed during Consolidation	User-Defined	Y
Consolidation Zone	Zone ID which should be processed	User-Defined	Y



Consolidation Dedication Configuration

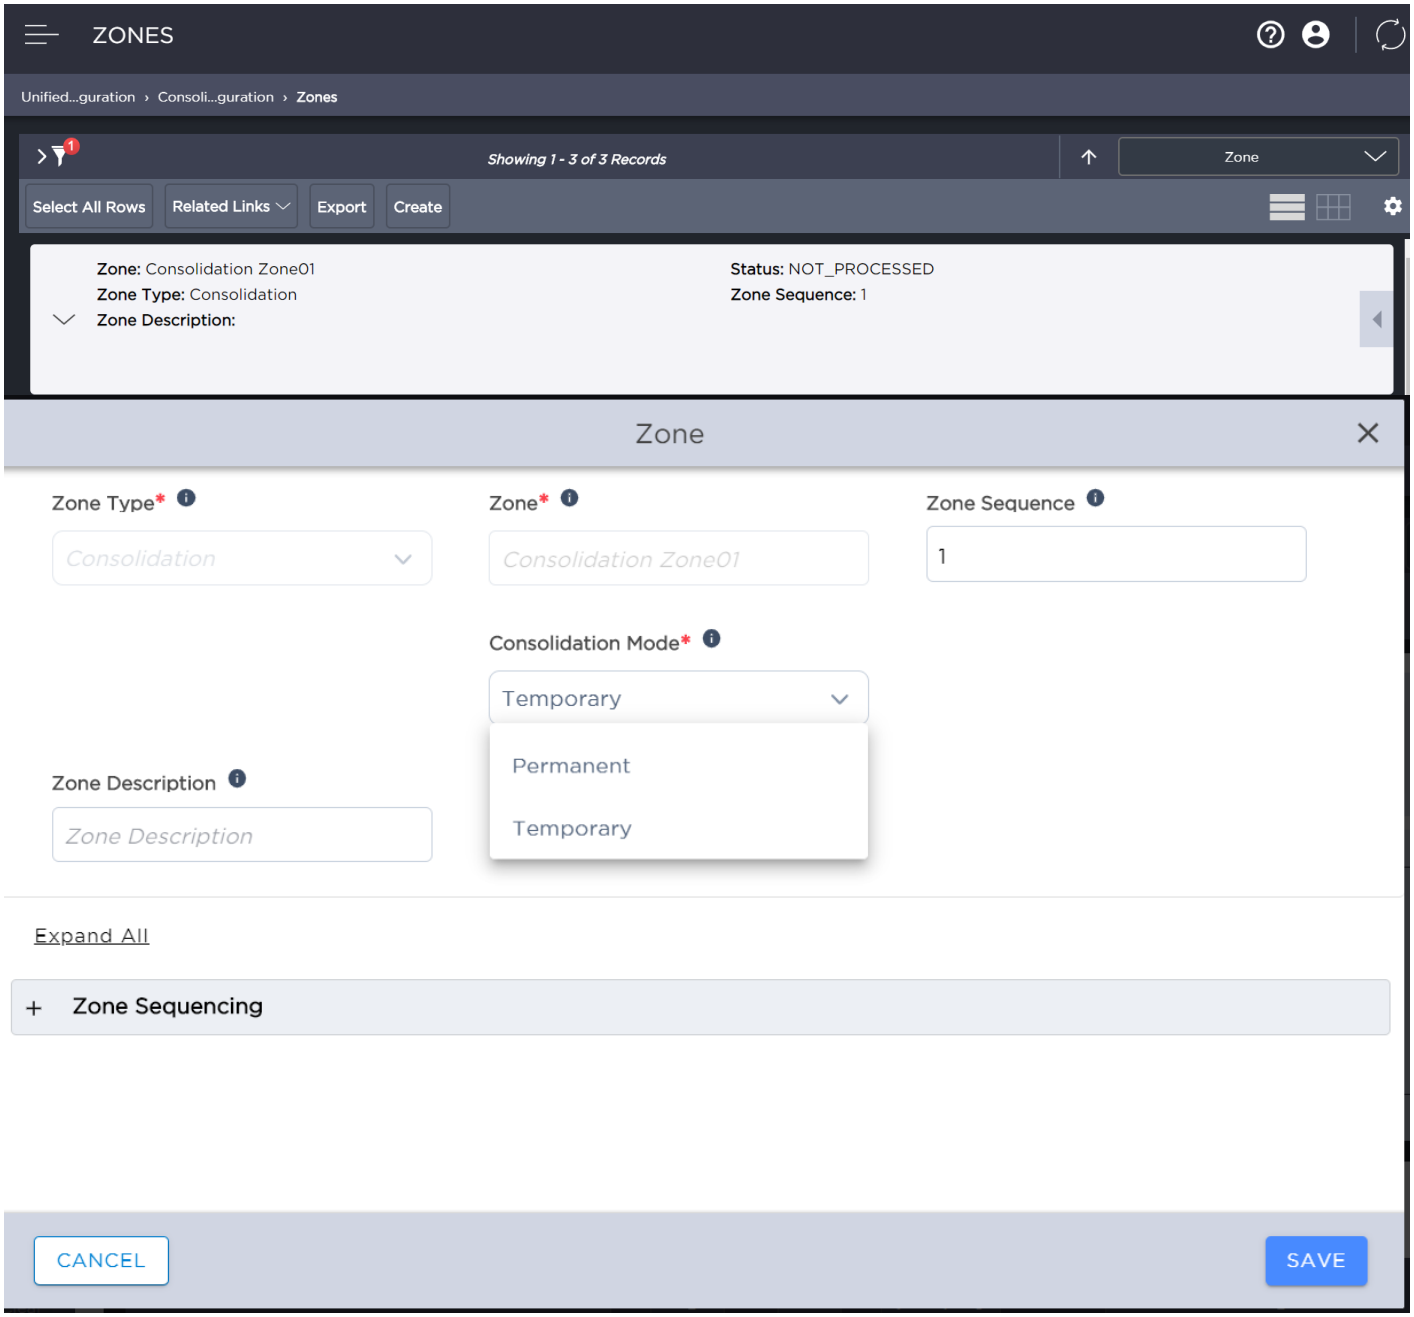
Consolidation Dedication configuration should be used to configure a list of oLPN Header attributes to which a Consolidation Location or Zone can be dedicated. This configuration is referenced in the Consolidation Criteria.

UI Display Text	Description	Valid Values	Mandatory
Dedication Configuration	Dedication Configuration Name	User-Defined	Y
Description	Description of the Dedication configuration	User-Defined	N
Dedication by Attribute	Choose from the list of attributes available on the oLPN Header	Dropdown of Pre-configured list	Y
Dedication Level	Dedication will be applied at the specified level.	Zone Location	Y
Dedicate by Attribute Value	If a static value needs to be assigned for the dedication attribute and matched with the oLPN during assignment, the value is provided here. If it does not match, the location is not assigned due to dedication mismatch.	User-Defined	N



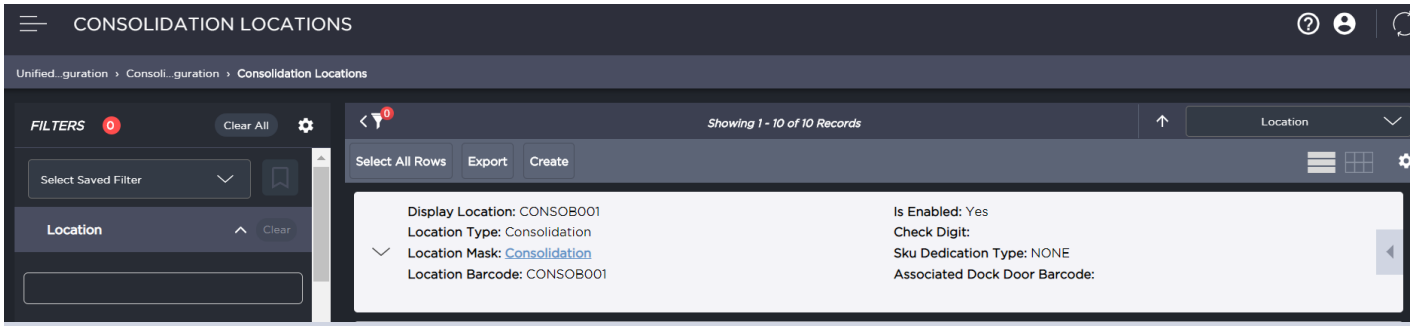
Zone

Zone should be used to configure whether permanent flow or temporary flow is used during consolidation. For more details on the zone, refer Location Configuration guide.



Consolidation Location

Consolidation locations are configured for assignment. For more details on the different fields of a consolidated location, refer Location Configuration guide.



Location

Location Type: Consolidation
Location Mask: Consolidation
